# JORENKU Piglet Combi

**Piglet Combi is the small alternative, that makes the big difference in the piglets' pens by keeping it dry combined with strong disinfectant qualities.**

Piglet Combi is effective pen bedding consisting only of specially selected material designed to absorb damp and moisture in the piglets' pen contemporary with it reducing the bacterial level by supplying the good absorption and disinfection qualities of Staldren® with straw, moclay, potato flour, and essential oil.

Piglet Combi has a good absorption because it i.a. contains rapeseed straw, which has a higher absorption than cereal straw, that is used in other similar products on the market. Therefore, Piglet Combi has a strong drying effect on the stable floor and a good effect on spores and bacteria - contemporary with it acting as pen bedding with a minimum of dust.

Consequently, Piglet Combi can entirely replace the use of other desiccants in the piglets' pen.

The frequent causes of umbilical hernia are prevented with Piglet Combi because the piglets' pen is kept disinfected and dry, contemporary with the qualities of Staldren® reducing the risk of piglet scour. Therefore, the composition of Piglet Combi secures a healthier start in life for the piglets as well as a good and clean environment with a minimum of dust.

Piglet Combi is available in bags of 15 kg and on pallets with 40 bags.
