JORENKU Staldren® Salve

Staldren® Salve is used for skin repair and wound healing on animals to avoid infection of bacterium.

Staldren® Salve is a specially developed disinfectant and desiccant ointment for external use on (open) wounds and irritated skin etc. on pigs, cattle, sheep, horses, dogs, and cats.

The ointment is based on the good qualities of Staldren®, which means that it, in addition to being disinfectant and desiccant, also keeps flies away, which helps to prevent infection of bacterium.

Staldren® Salve has a good texture that makes it easy to spread. The ointment is spread directly on the wound in a covering layer until a scab develops on the entire wound. In this way, effective wound healing is achieved on e.g., shoulder sores and cuts. Additionally, a positive effect is seen on e.g., ringworm and malanders.

Application is repeated daily or as required until the problem is gone. By repeated application, it is not necessary to remove previously applied ointment, as it must form an artificial scab. By wound healing repeated application is required.

With Staldren® Salve visible results are achieved in a short time.

Staldren® Salve is available in tubes with 250 ml and in boxes with 15 tubes.

JORENKU Staldren® Salve

Staldren® Salve

Skin ointment with disinfectant effect

- Effective wound healing - especially on shoulder sores among farrowing sows
- Disinfectant and desiccant
- Keeps flies away
