JORENKU Mineral Sprayer

In collaboration with Bobman, Jorenku A/S has developed a sprayer for assigning liquid minerals directly into the feed mixer.

After adding various roughage into the feed mixer, it only requires one press of a button, and the Mineral Sprayer assigns the amount of minerals that have been predetermined.

It means easier working days without heavy lifting and mixing of minerals.

The benefits of liquid minerals

Studies of liquid minerals have proven that liquid minerals ensure a better utilization of the minerals compared to traditional assignment of minerals, as the bloodstream of the cattle utilise a higher amount of minerals. It means:

1. The amount dosed can be reduced (30–60 g per animal unit).
2. The content of minerals in the dung is diminished, which means less impact on the environment - particular as regards to phosphorus, zinc, and copper.

The Benefits of Dan-Liq Cattle

Jorenku A/S produces both liquid minerals and vitamins. In addition to standard blends, customised individual blends are made in cooperation with the resident consultant.

Jorenku A/S has developed the liquid mineral Dan-Liq Cattle, which is a concentrated solution of electrolytes with the elements: phosphoric acid, magnesium, zinc, manganese, copper, and the trace elements: iodine, cobalt, and selenium. The composition is precisely adjusted to the needs of the cattle.

Dan-Liq Cattle stimulates the function of the cattle's rumen flora, as the microbisms in the rumen need the trace elements for all essential functions for digestion of the feed.

Dan-Liq Cattle does not contain calcium to provide the right acid-base balance and enable a rapid absorption of the most important elements in the small intestine. Calcium is separately added to the feed.
